

Jingzhang Commons Weave turns the heritage line, AI innovation and daily civic life into a walkable, auditable and operable public spine.

CENTENNIAL JINGZHANG AI INNOVATION BELT

A civic spine for heritage, AI and daily life

One belt • three anchors • a connected blue-green commons

Design emphasis stays on corridors, nodes and public-space relationships; the boundary is provisional.

Scope / Three levels

Research, overall design and key-area design are connected by one evidence chain.

CENTENNIAL JINGZHANG AI INNOVATION BELT

Layered land-use structure

Research, park, industry and civic life are linked by a shared public spine.

Bands are design concepts, not approved regulatory parcels.

Anchors / Three key areas

The three anchors support acceleration, origin-community life and industry services.

CENTENNIAL JINGZHANG AI INNOVATION BELT

Three anchors, three distinct public offers

Each key area has a role, spatial move, AI scene and implementation risk.

Provisional polygons are shown as light frames; the design proposition is the relationship between anchors.

Mobility / Blue-green loop

A slow-mobility loop connects rail access, the heritage park and public AI nodes.

CENTENNIAL JINGZHANG AI INNOVATION BELT

A slow-mobility and blue-green operating loop

Rail access, heritage park, small streets and AI services share one legible loop.

The corridor is a reference scheme for professional deepening, not a committed road redline.

Metrics are recomputable; official boundaries and controls remain a human review gate.

CENTENNIAL JINGZHANG AI INNOVATION BELT

Metrics are evidence, not decoration

Known values are recomputable; pending controls stay visibly pending.

Area values use EPSG:4548 calculation and remain provisional until official polygons replace the intake boundary.
